

Reflection 2

Yuxiao Ma 5916305

Looking back at what I wrote about how science and philosophy are connected, especially in understanding knowledge, I still agree with my original thoughts. Philosophy provides us with a way of thinking about what we know and how we know it, which is important for doing scientific research correctly. When scientists conduct experiments, they use philosophical ideas to make sure they are on the right track.

I also still believe philosophy is important in making sense of science. Big questions like whether we should clone humans or how to use artificial intelligence require philosophy to guide us. Philosophy helps ensure that scientists don't just follow the crowd, but are constantly thinking about new, creative ideas.

So, my opinion has not changed. Science and philosophy need each other. Philosophy grounds science and ensures that it keeps moving in the right direction.
